

Data Visualization Report

Generated: 2026-05-11 19:02 · 7/7 charts

1 Monthly Payment Volume & Revenue Trend

Tracks total payment count and summed amount over time to identify growth trends, seasonality, and revenue momentum across the business.

- Explosive launch growth:** Revenue surged from \$4,689 in April 2018 to \$347,635 by August 2018 — a **74x increase in just 4 months** — with payment count growing from 54 to 2,670 transactions.
- Mid-summer dip then recovery:** September 2018 saw a notable pullback (-23% revenue, -1,082 payments vs. August), but October rebounded sharply to \$545,743 across 4,699 payments — the strongest month yet in the dataset shown.
- Strong momentum into 2019:** January 2019 reached \$828,858 and 6,182 payments, representing a **52% revenue jump** over October 2018's previous peak, signaling sustained upward trajectory heading into the new year.

```
SELECT DATE_FORMAT(charge_date, '%Y-%m') AS month, SUM(amount) AS total_amount, COUNT(id) AS payment_count FROM payments GROUP BY DATE_FORMAT(charge_date, '%Y-%m') ORDER BY month LIMIT 30
```

2 Payment Volume by Industry Vertical

Reveals which industry verticals generate the most payment activity, helping prioritize sales and support resources toward the highest-value segments.

- Digital Services, Media & Telecoms dominates** with £1.19M in payment volume, accounting for ~29% of total activity — nearly 1.5x the second-highest vertical and the clear priority for sales investment.
- Top 3 verticals (Digital Services, Professional/Financial Services, Sports & Fitness) contribute ~67%** of total payment volume (£4.28M combined), suggesting resources should be heavily concentrated here.
- Healthcare and Societies & Clubs are underperforming** relative to their market potential, generating £368K and £171K respectively — representing growth opportunities with targeted outreach or product improvements.

```
SELECT o.parent_vertical AS `Industry Vertical`, SUM(p.amount) AS `Total Payment Amount` FROM payments p JOIN mandates m ON p.mandate_id = m.id JOIN organisations o ON m.organisation_id = o.id GROUP BY o.parent_vertical ORDER BY `Total Payment Amount` DESC LIMIT 30
```

3 Mandate Scheme Distribution

Shows the breakdown of mandates by payment scheme (e.g. BACS, SEPA) to understand scheme adoption and exposure to scheme-specific regulatory or operational risk.

- BACS dominates mandate volume with 9,017 mandates (96.1% of total), indicating heavy concentration in UK-based direct debit infrastructure and significant exposure to BACS-specific regulatory changes.
- SEPA Core accounts for just 364 mandates (3.9%), suggesting limited European market penetration or early-stage expansion into eurozone payment corridors.
- The 25:1 ratio between BACS and SEPA Core mandates highlights a near single-scheme dependency, posing operational risk if BACS experiences disruption—diversification into SEPA or other schemes should be evaluated as a resilience measure.

```
SELECT scheme, COUNT(id) AS mandate_count FROM mandates GROUP BY scheme ORDER BY mandate_count DESC LIMIT 30
```

4 New Mandates Created per Month

Monitors mandate acquisition growth over time to assess onboarding health and whether the customer base is expanding, plateauing, or contracting.

- Peak acquisition occurred in June 2018** with 1,183 new mandates, followed by a sharp 40% decline to 701 mandates by October 2018, signaling a post-launch correction after rapid early growth.
- Onboarding ramped explosively** from just 1 mandate in March 2018 to 990 in May — a 98,900% surge in two months — indicating a major product launch or market entry event drove initial volume.
- A recovery trend emerged late 2018**, with mandates rebounding from the October trough of 701 back to 1,004 by December, suggesting the customer base stabilized rather than contracted after the mid-year peak.

```
SELECT DATE_FORMAT(created_at, '%Y-%m') AS month, COUNT(id) AS new_mandates FROM mandates GROUP BY  
DATE_FORMAT(created_at, '%Y-%m') ORDER BY month LIMIT 30
```

5

Average Payment Amount by Payment Source

Compares average transaction value across different payment sources to identify which channels drive high-value payments versus high-volume low-value ones.

- API drives highest-value transactions**: API payments average \$185.34, approximately 18% higher than dashboard (\$156.50) and 131% higher than app (\$80.39), despite being the lowest-volume channel at only 2,316 transactions.
- Dashboard dominates volume with mid-tier value**: Dashboard processes the most payments (17,693 — nearly 57% of total transactions) at a mid-range average of \$156.50, suggesting it serves as the primary operational channel.
- App is high-volume but low-value**: The app handles 13,452 transactions but yields the lowest average at \$80.39 — roughly half the API average — indicating app users make frequent, smaller-ticket payments compared to API/dashboard users.

```
SELECT source, AVG(amount) AS avg_amount, COUNT(id) AS payment_count FROM payments GROUP BY source ORDER BY avg_amount DESC LIMIT 30
```

6

Top 15 Organisations by Total Payment Revenue

Identifies the highest-revenue organisations to support key account management, churn risk monitoring, and upsell targeting for the most critical clients.

- The top organisation (cb4fb774) dominates with ****\$305,347**** in revenue — nearly 19% more than the second-ranked (6c87af1f) at ****\$256,617****, making it the highest-priority account for retention and relationship management.
- A significant revenue cliff exists between rank 8 (****\$143,469****) and rank 9 (****\$112,164****) — a ****\$31,305 drop (22%)**** — suggesting a natural tier break that can segment key accounts from secondary targets.
- The top 3 organisations collectively generate ****\$798,650****, representing a concentrated revenue risk; losing any single one would materially impact overall payment revenue and warrants dedicated churn monitoring.

```
SELECT o.id AS organisation_id, SUM(p.amount) AS total_revenue FROM payments p JOIN mandates m ON p.mandate_id = m.id JOIN organisations o ON m.organisation_id = o.id GROUP BY o.id ORDER BY total_revenue DESC LIMIT 15
```

7

Payment Frequency vs. Average Amount per Organisation

Plots each organisation by how often they pay versus their average transaction size to segment clients into high-frequency/low-value vs. low-frequency/high-value buckets for tailored strategy.

- Dominant outlier:** Organisation `6c87af1fc07f4a94` leads in payment frequency at 6,612 transactions but averages only \$38.81 — a classic high-frequency/low-value profile requiring volume-based, automated engagement strategies.
- High-value opportunity:** Organisation `e00a57ec92dc42f9` combines relatively high frequency (930 payments) with the largest average transaction of \$224.68 — nearly 6× the top payer's average — making it a priority account for dedicated relationship management.
- Mid-tier cluster:** Organisations ranked 3rd–5th (counts 939–1,924) all average \$36–\$44, suggesting a homogeneous low-value segment despite moderate frequency, where standardised pricing or upsell campaigns could meaningfully lift revenue per transaction.

```
SELECT o.id AS organisation_id, COUNT(p.id) AS payment_count, AVG(p.amount) AS avg_amount FROM payments p JOIN
mandates m ON p.mandate_id = m.id JOIN organisations o ON m.organisation_id = o.id GROUP BY o.id ORDER BY
payment_count DESC LIMIT 30
```
